How to clone and push into github

Website:

https://github.com/Likhith025/timetablegen.git

To clone it, use the below command

"git clone git@github.com:Likhith025/timetablegen.git"

Do changes and run in your local host and then create a new branch and push it

Then you have to create a new branch or either you can change in your previous branch as well. You can't do anu changes in main branch because it is protected.

Command to create new branch:

git checkout -b branch_name

Normal Command

git add .

In case if u are changing only frontend or only backend, use

git add frontend (to only push frontend. Preferably, if you are working on the frontned, please use this command)

git add backend (to only push backend, ise git add backend. If u are working on backend and push backend. Preferably use this command).

git commit -m "message"

git push origin branch_name

Once you clone, don't need to clone always instead use,

git pull origin branch_name
